

ondia

The logo for 'ondia' is centered on a white background. The word is written in a lowercase, rounded sans-serif font. The letters 'o', 'n', and 'd' are a medium purple, while 'i' and 'a' are a darker blue. A light blue and teal graphic element, resembling a stylized 'd' or a corner bracket, is positioned behind the 'd'. The corners of the image are decorated with purple triangular shapes.

Open System Interconnection (OSI) Specifications

What is OSI Reference Model?

What is OSI Reference Model?

The **OSI** provides a standard for different computer systems to be able to communicate with each other

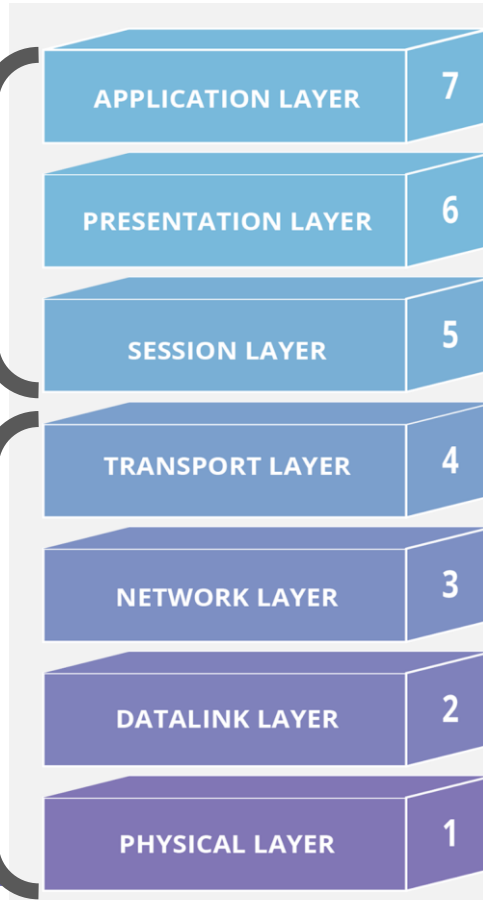

Developed by ISO in 1984

What is OSI Reference Model?

Lower Layers **Upper Layers**
(Network) **(OS)**

- Human-computer interaction layer, where applications can access the network services
- Ensures that data is in a usable format and is where data encryption occurs
- Maintains connections and is responsible for controlling ports and sessions
- Transmits data using transmission protocols including TCP and UDP
- Decides which physical path the data will take
- Defines the format of the data on the network
- Transmits raw bit stream over the physical medium

2

Layers of the OSI Model

Application Layer (Layer 7)

- Directly interacts with data from the user
- Software applications (web browsers, email clients, etc.) rely on the application layer to initiate communications

► Presentation Layer (Layer 6)

- Primarily responsible for preparing data
- Translates, encrypts, and compresses data

Session Layer (Layer 5)

- Responsible for opening and closing communication between the two devices
- The time between when the communication is opened and closed is known as the session
- Synchronizes data transfer

Session of communication

Transport Layer (Layer 4)

- Responsible for end-to-end communication between the two devices
- Takes data (from upper layer) and breaks into segments
- Responsible for flow control and error control

▶ Network Layer (Layer 3)

- Facilitates data transfer between two different networks
- Takes data segments (from upper layer) and breaks into packets

▶ Data Link Layer (Layer 2)

- Facilitates data transfer between two devices on the same network
- Takes data packets (from upper layer) and breaks into frames
- Responsible for flow control and error control

Frame Creation

Transport

Transfer frames between
network nodes

► Physical Layer (Layer 1)

- Includes physical equipment
 - cables
 - modems
 - transceivers
 - etc.
 - repeaters
 - media converters
 - hubs
- Data is converted into bit streams

3

Data Encapsulation

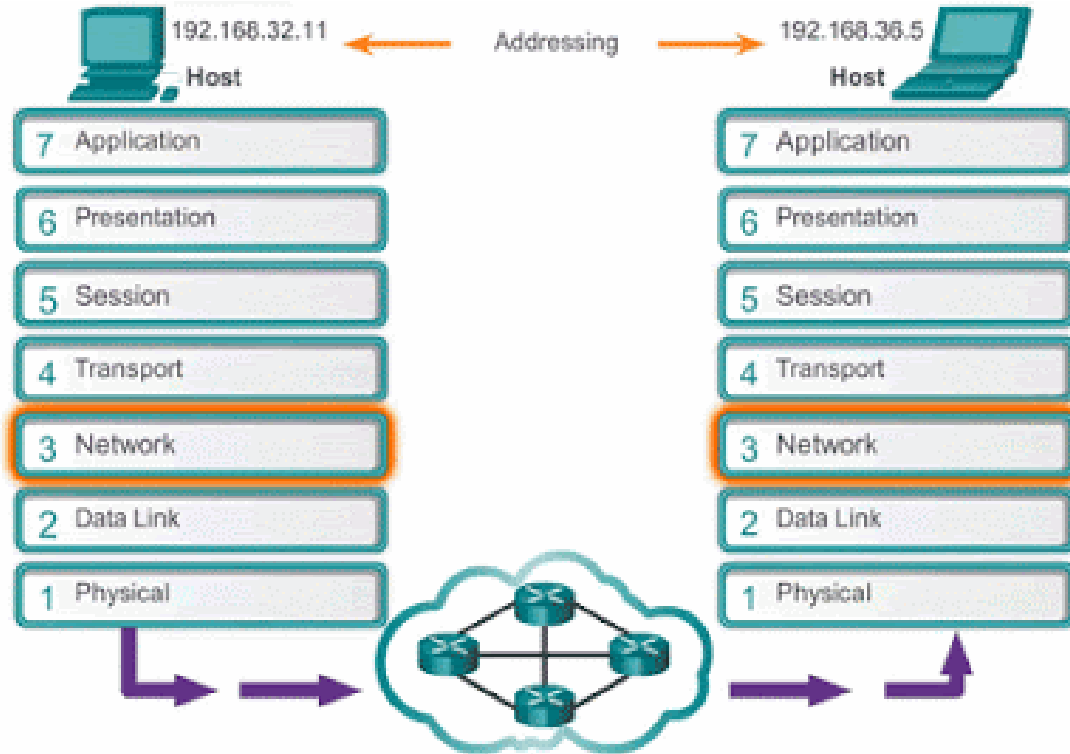

Data Encapsulation

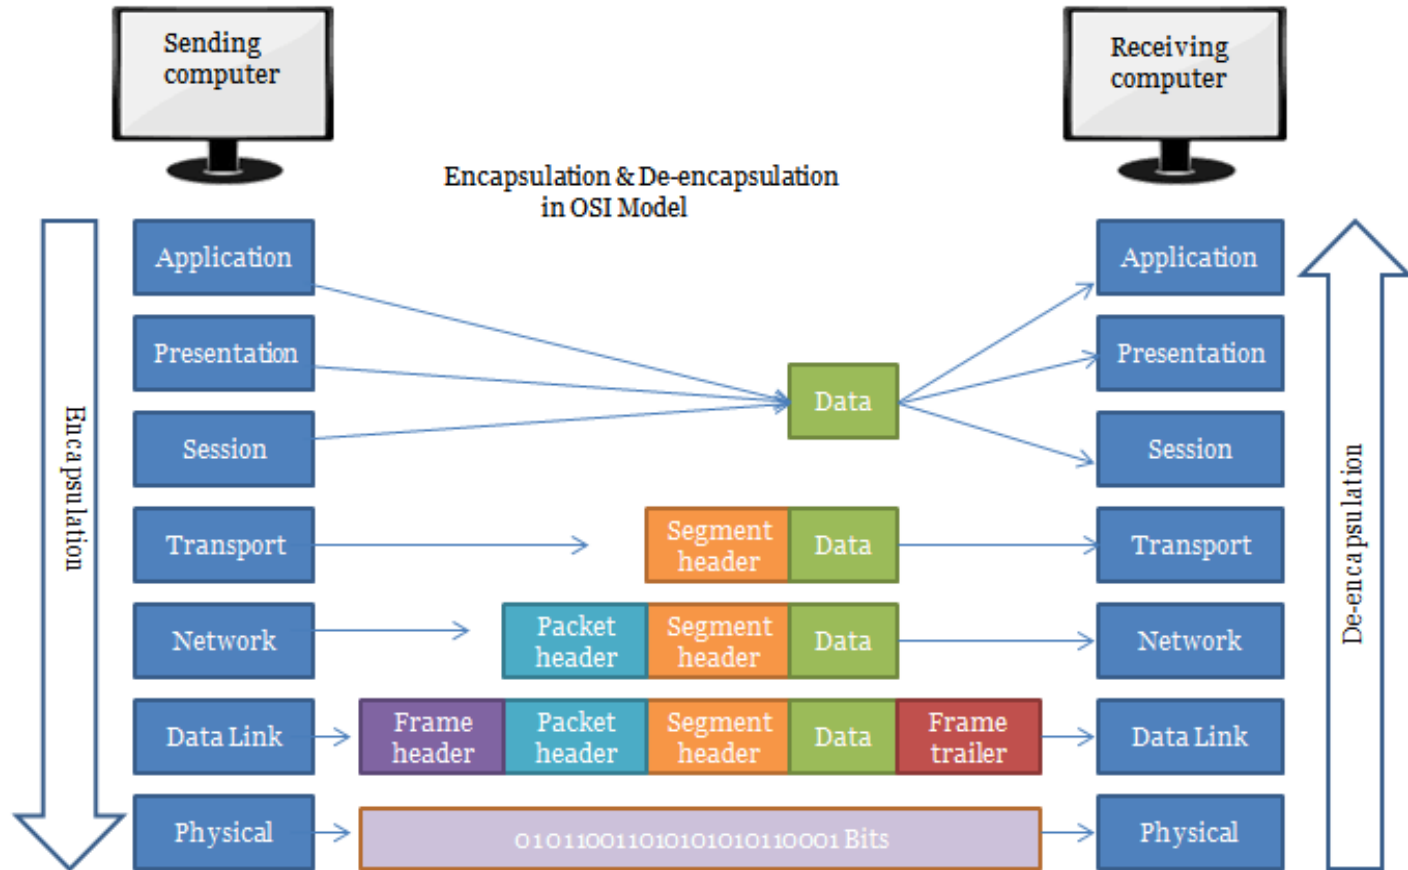

- For two nodes communicate they must use the same protocol
- Each layer (*OSI* or *DoD*) communicates with its equivalent layer on the other node via the lower layers of the model
- Each layer provides services for the layer above and uses the services of the layer below

▶ Data Encapsulation

Data Encapsulation
